Error Color

Here's the full reasoning behind each role:

Primary – is the brand's action colour. Every CTA button, scan trigger, earned points indicator, and active state uses it. It's the colour that means go and earned.

Secondary – handles premium surfaces – the loyalty card background, the nav bar, dark overlays. It gives the brand depth and stops it feeling flat or cheap.

Tertiary – is reserved for tier badges, streak highlights, and special reward moments. It adds warmth and signals something valuable, without competing with the primary color

Neutral – covers all body text, metadata, dividers, and screen backgrounds. It keeps the UI readable without adding visual noise.

Neutral Variant – is a low-saturation relative of the primary. It's used for success state backgrounds, input focus rings, and active tab tints – gentle feedback that something worked.

Error – is only used for failed scans, unreadable receipts, expired vouchers, and form validation. Because it appears rarely, it carries real urgency when it does.
